

**TiiQu** 

CERTiif and VERiif redesign

The User Experience of a Block-chain Certifier and Verifier : The certifier and verifier is a software application developed by TiiQu Ltd which allows institutions to issue certifications that are rich in details, and can be instantly verified by anyone at any time. The collaboration will aim to:

- Analyse the existing certifier and verifier system to gain familiarity with it.
- Identify the structure and level of detail a degree certification from Northumbria would need to / ideally have.
- Test the certifier and verifier system to identify user experience improvements for both the institution issuing certifications, the recipient of the certification and the institution verifying the integrity of the certification.
- Implement the user experience improvements identified in section C
- Test the improved system with a trial sample of participating students of Northumbria University

# Existing website research

iCredify is an Indian University verification website designed to verify degree certificates. The system works the same as TiiQu but there are clear differences in layout but content is different

## Appearance

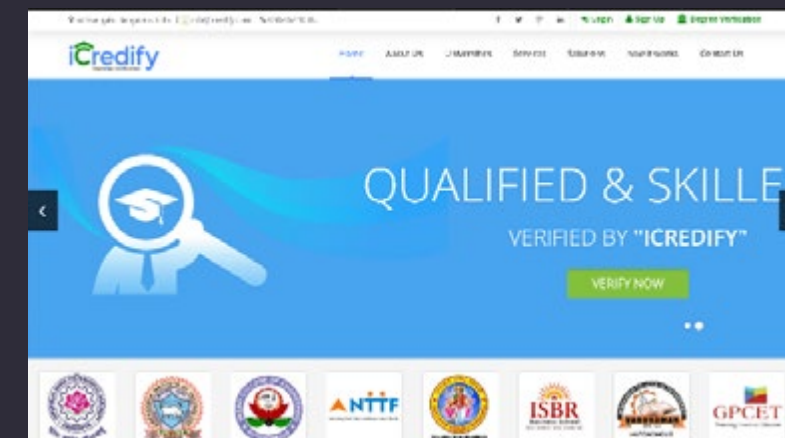

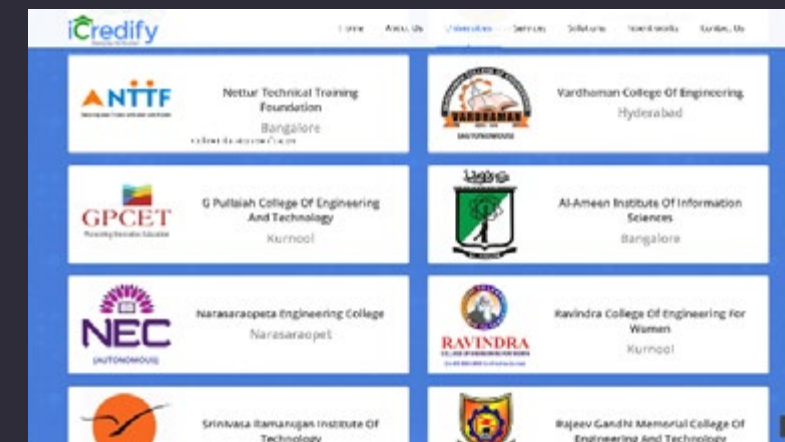

- Clear layout, designed to present clear information towards the user.
- Pictures with University clients
- Strong blue bars along with green icons to stand out clear information to the user.

## Usability

- Toolbar neatly displaying website content.
- Top of website displaying company information and social media likes

## The Degree form

- Two Forms which allows the user to fill in information about what degree they do.
- The use of drop down menu's
- Contact Details are displayed in the top section

# Existing website research

DegreeVerify is the system used by the US firm National Clearing House. Their objective is support the US educational acts in various forms

## Appearance

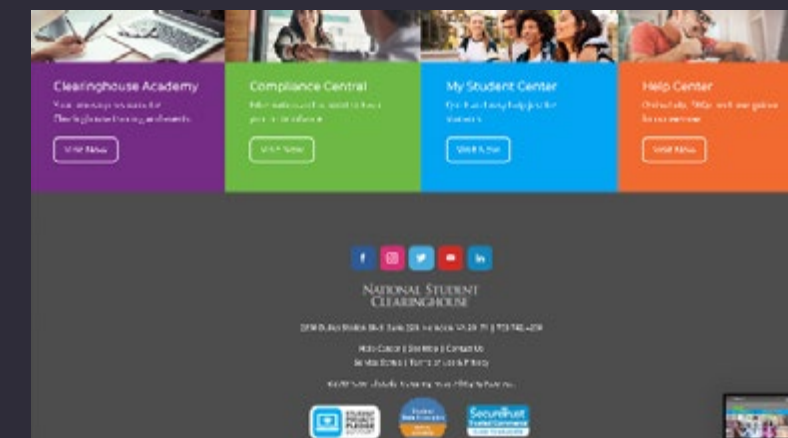

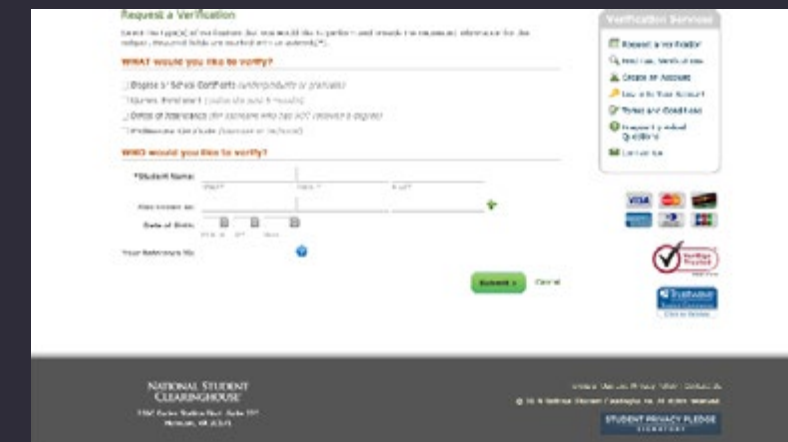

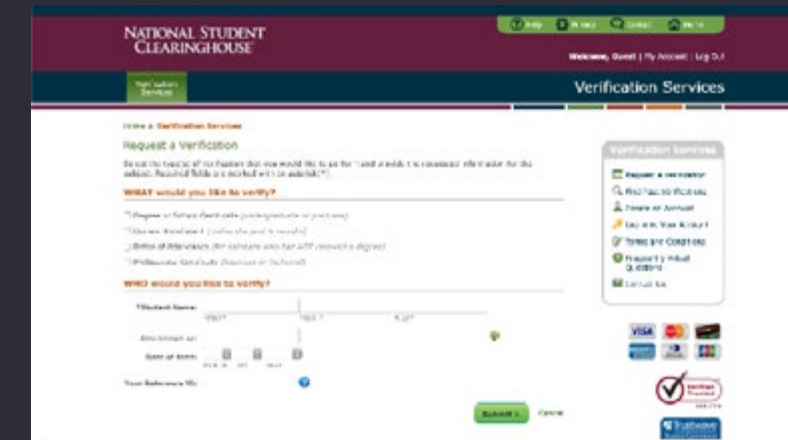

- Bleak grey colour scheme, gives across a serious manor
- Using strong vibrant colours to separate different sections of the website
- Social media icons are displayed in the bottom of the website

## Usability

- Toolbar neatly displaying website content.
- Top of website displaying company information and social media likes

## Degree Form

- Two Forms which allows the user to fill in information about what degree they do.
- The use of drop down menu's
- Left side bar displaying important links and FAQ about degree certification
- Payment information displayed in the left hand side

# Background Research

These images are the screen shots of Expedia website. It shows how the website works and the flow of the pages. We use this as an example and research for the UX and UI of this website to see which part we may adapt to apply on the interface design and experience of using the TiiQu CERTiiF software such as colours, contrast, consistency, typeface, buttons, loading pages, and user experience.

## Daniel Adams

Age: 32

Location: London

Occupation: Immigration office

Daniel is a hard working member of the goverment immigration office team. He lives at home with his wife and daughter and often finds himself stressed with work.

He is responsible for sorting through a variety of immigration documents, such as visas, green cards, citizenship applications etc. He often has to make great effort to dig through the applicants details and history to know if they are indeed who they say they are, and to avoid illegal immigration into the company via fraudulent and forged personal documents. The system he uses while at work is slightly dated and it is definitely taking its toll on the accuracy of his work.

### Movtivations

### Goals

- To impress his boss.
- To make his life less stressful.
- To enjoy more time with his family.
- To make less for work himself.
- To reduce bringing work home with him.

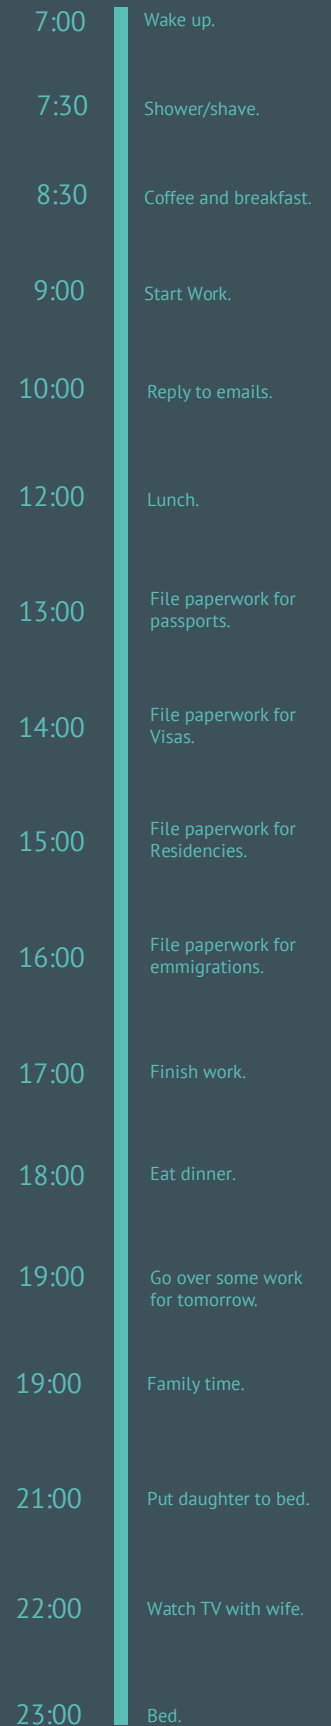

### Looking to improve

- To improve his productivity
- To build his IT skills.
- To eat healthier.
- To enjoy his work more.
- To cut down on caffiene

### Scenario

Even with his skills and knowledge, he does make the occasional mistake. Recently due to the extra stress of work he has gotten himself into trouble for accidently giving an illegal immigrant access into the country. He needs a way of easily checking the validity of the documents with a simple yes/no solution to his growing stress. By using the Tiiqu Certiif and Veriif applications he would easily be able to check whether or not the document he is viewing is legitimate or fraudulent. Which would solve the problem of his stress and would also allow him to do his job much more effectively.

### Day in the life

## Maria White

Age: 24

Location: Manchester

Occupation: Estate agent

Maria graduated top of her class at university studying real estate and she has recently got a job as an estate agent. She is doing very well for herself and she is learning more and more about her new occupation every day. She gets a lot of applicants for housing and residency from foreign countries and often has to spend hours sifting through heaps of paperwork from abroad with many applicants trying to forge identity or use false information.

She often has to conduct extensive background checks for applicants who make false claims, and then having to wait for the checks to verify to continue with her process. She is finding it to be the most tedious aspect of her new job.

### Movtivations

### Goals

- To be promoted at work.
- To increase her income.
- To build a name for herself.
- To impress her parents.
- To pay off her student loans.

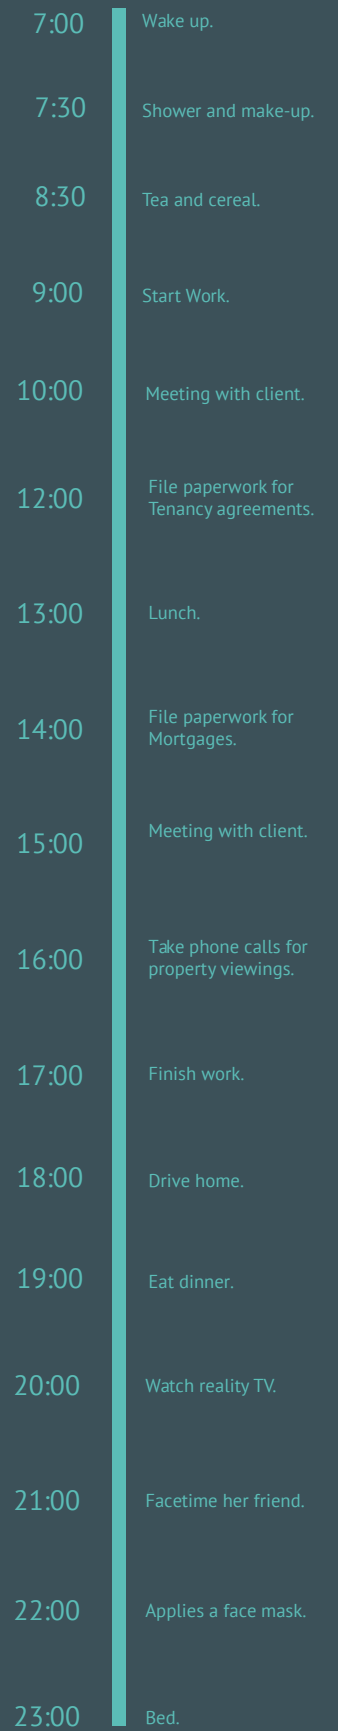

### Looking to improve

- To try to network more.
- To improve investment strategies.
- To be more productive at home.
- To exercise more.
- To expand her skillset.

### Scenario

She is currently serving a client who is trying to put down a mortgage on a local property. The majority of his background checks add up other than his occupational records. He has provided proof of occupation with a hospital with a relatively low salary but he is applying for a mortgage on a very expensive property and his financial records are not adding up. She needs a way of accurately checking if he has some form of undeclared possibly illegal income. She would use Certiif and veriif to verify the applicants details and discover if he is being truthful or not.

### Day in the life

## Clara Woods

Age: 34

Location: Manchester

Occupation: Bank Manager

Clara is a 34 year old woman who is currently working in Barclay Bank in Manchester as a Bank Manager. Currently, the branch in her workplace has a vacancy in accountant position.

As the department manager, Clara is employing a new employee to be able to fit the accountant role. Firstly, she needs to determine whether the person has the qualification and skills to be able to do the job.

### Motivations

### Goals

- To lead her team to improve.
- Develop further knowledge in management and leadership.
- Always looking to spend free time with her friends
- To help the company's solve some financial problems and flaws.
- To guide her subordinate to coordinate with each others and importance of time management.

### Looking to improve

- Caring to her subordinates.
- Better knowledge in Information Technology.
- Taking care of her own health due to work overtime often
- To be fair and just when treating her subordinates.
- Strict in testing the skills and qualification of the employee when recruiting someone.

### Scenario

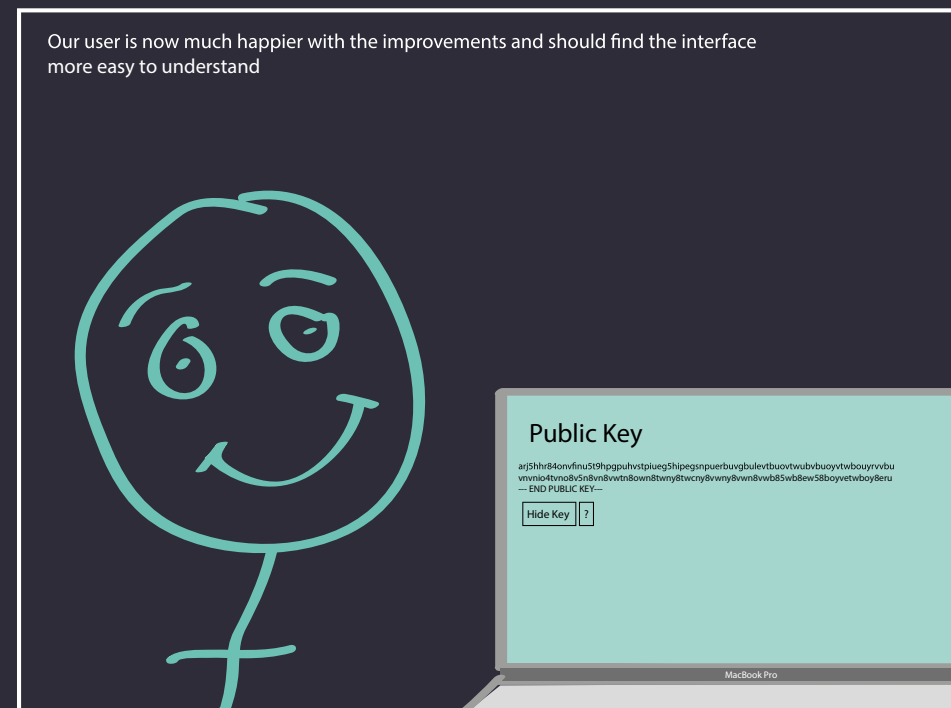

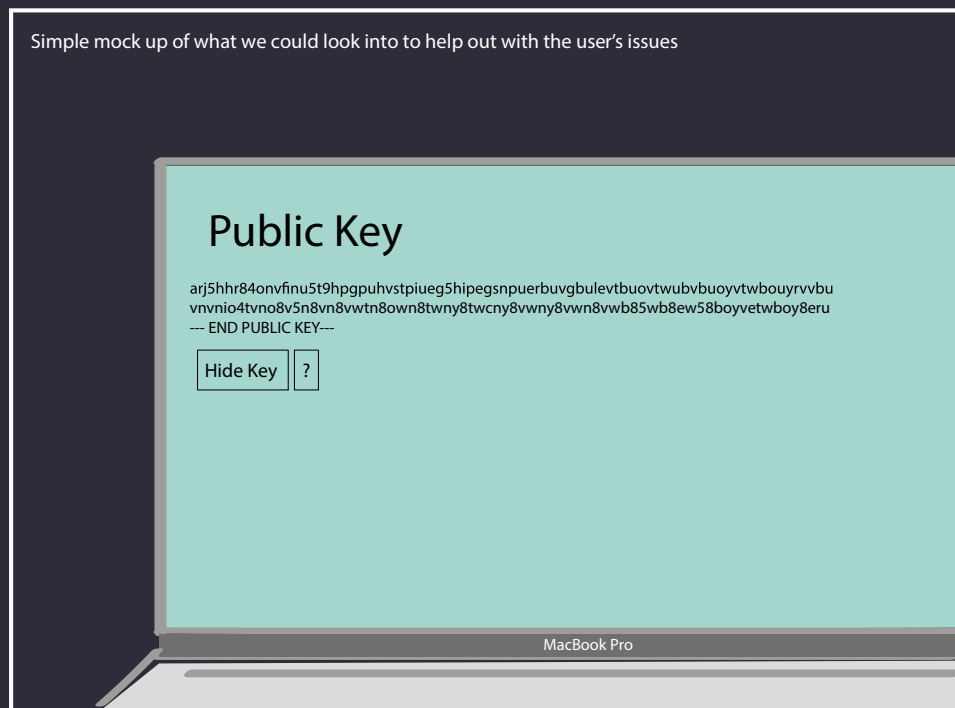

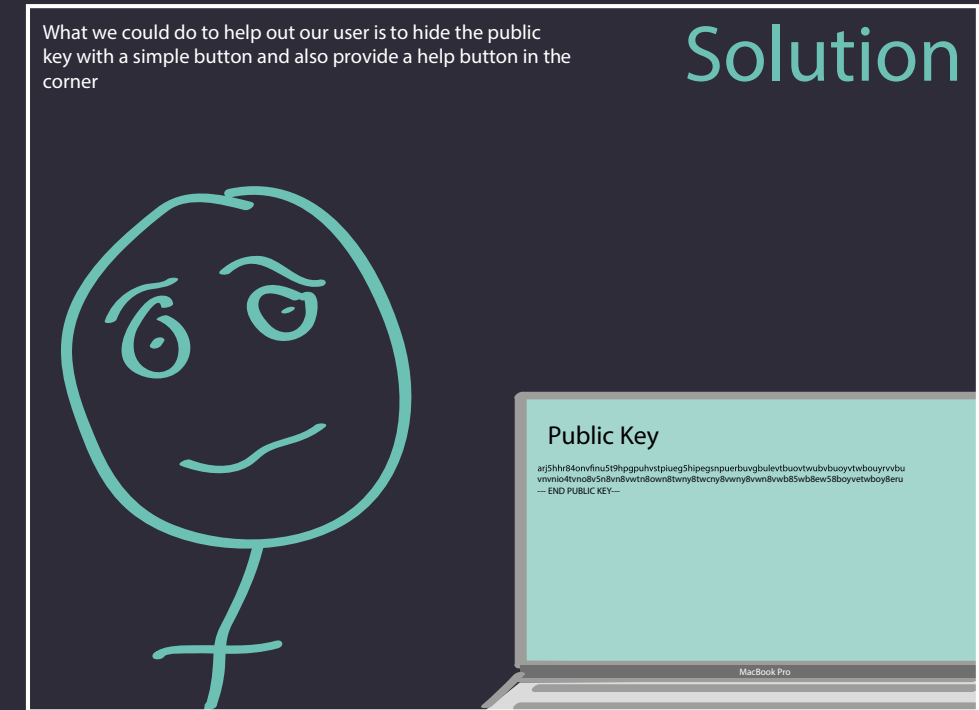

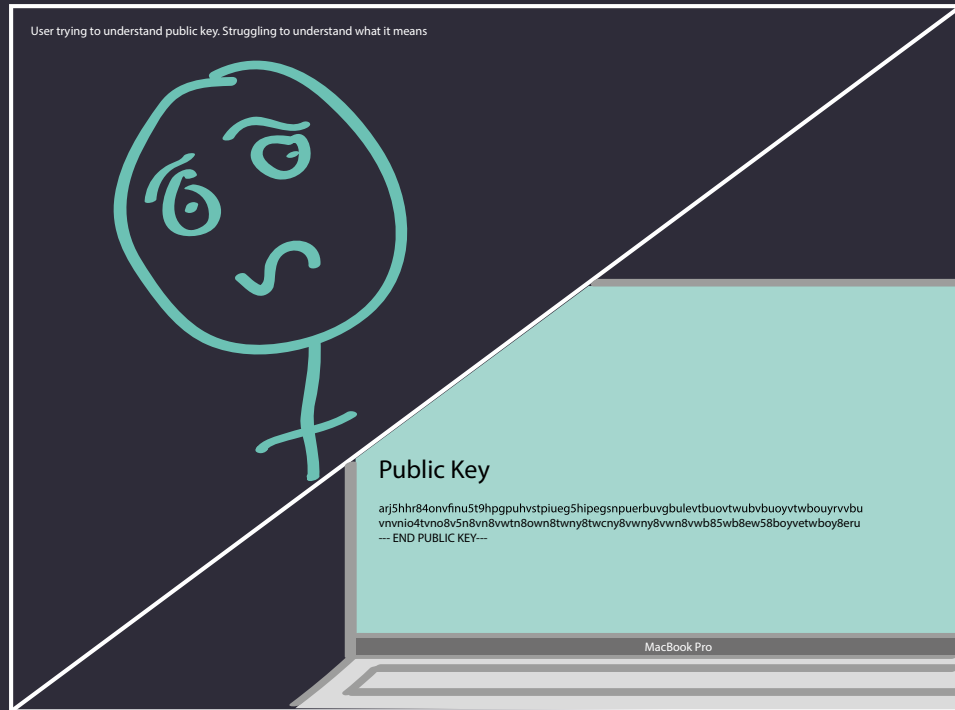

- Clara wakes up in 7.45am every weekdays, she brush her teeth and change her uniform. She had a cup of coffee before she left her house.
- Clara arrives at Barclay Bank, Mosley Street at 9am morning, she punch cards and greets to her peers and subordinates before she back to her office.
- Before Clara employing an employee, she needs to acknowledge that the person is able to fill in the position, so she needs to check the certificate of the candidate wisely.

### Day in the life

# Storyboard

Quickly creating a storyboard to demonstrate how we could help the user with a simple design change involving the public key

# Screen Analysis

Going through all the sections of Certiff and Veriif. Looking at what we could do to further improve the two areas.

- Metamask Integration
- Connection status visual progress bar
- Public Key copy button
- Hide the merkle root behind the button
- Tidy up element spacing
- Centralise page elements
- Consistent button colours
- Publishing address
- Element Spacing

- Result details visual
- Better presentation of certificate details
- No major visible flaws (top sheet)
- Potential for utilising the negative space
- Looking at icons

# Screen Analysis

TiiQu uses an extension called MetaMask to let user upload the data to the Blockchain by using the currency called Ethereum.

MetaMask uses the parity on-chain registry of function signatures to display method names on the confirm screen. For many common method names, like token methods, this allows MetaMask to successfully look up the method names by their method signature.

- Using TiiQu interface
- Using TiiQu colour scheme
- Build metamask into the colour scheme

# Wireframes

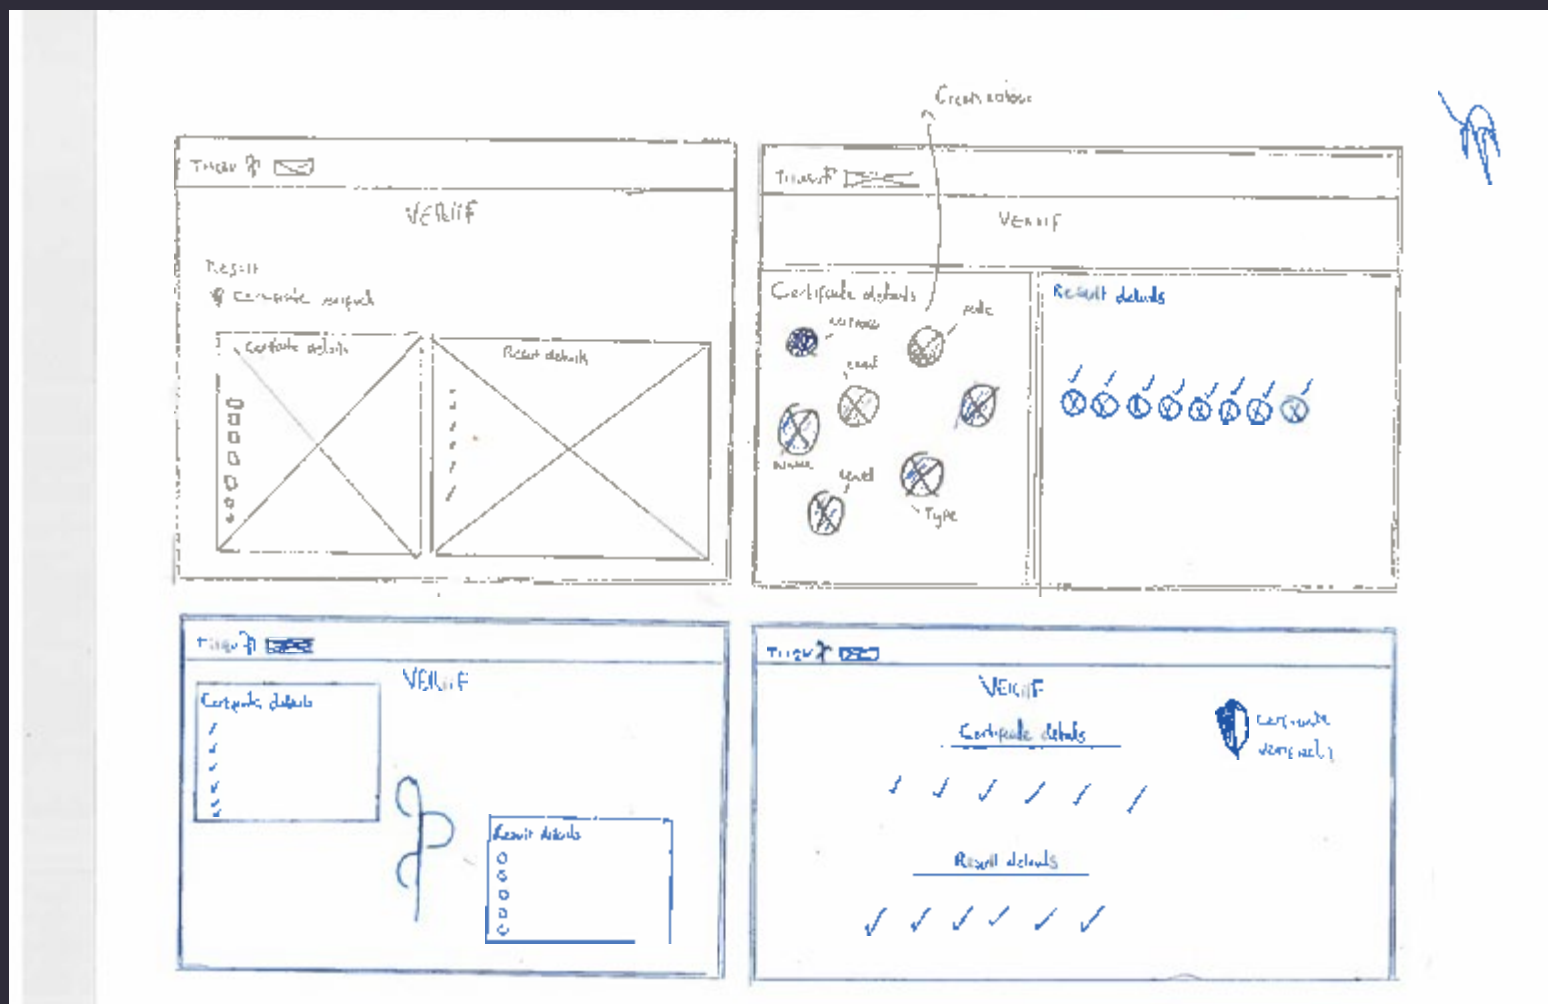

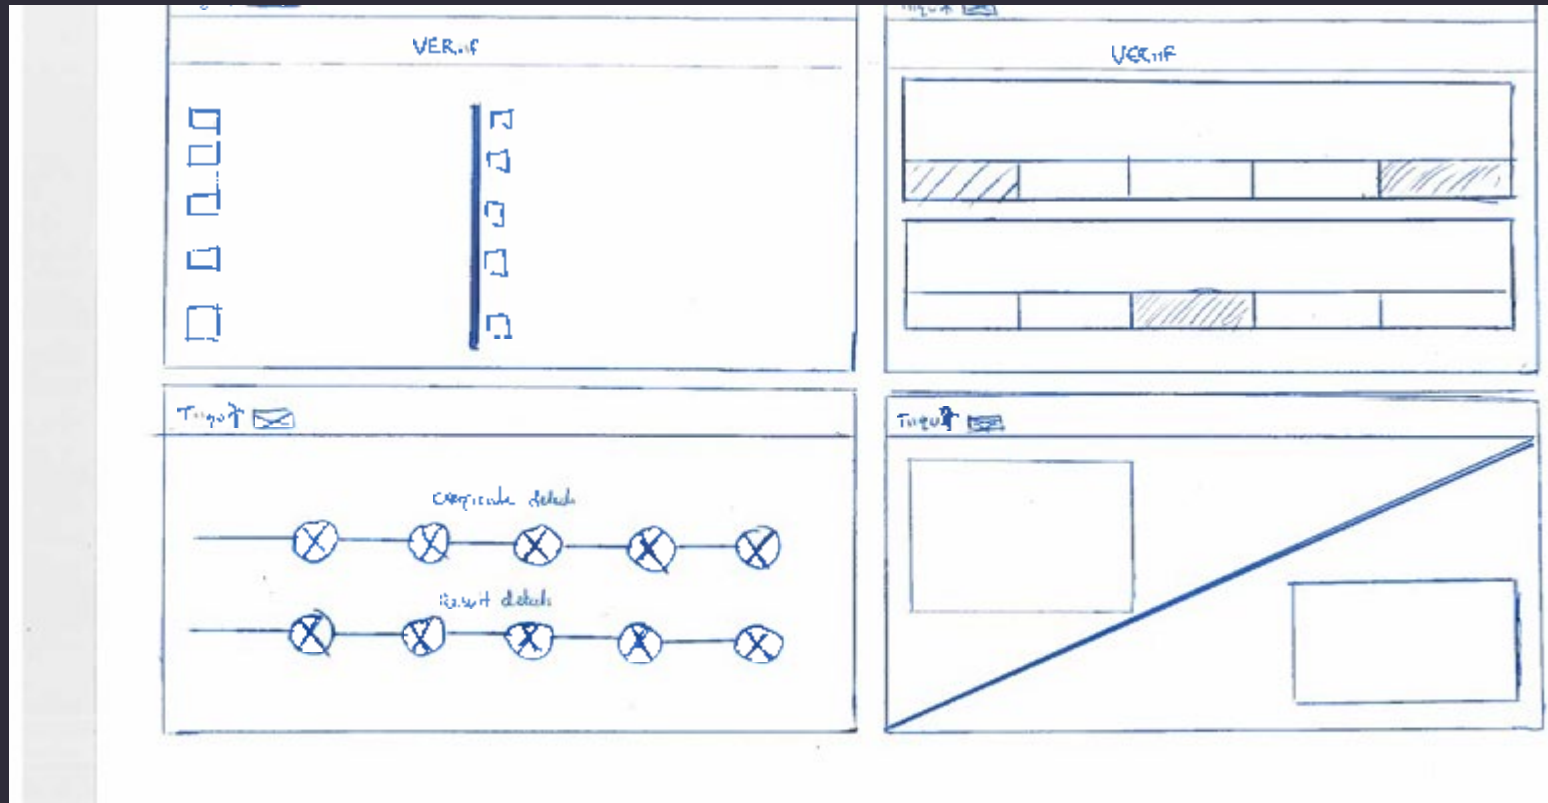

Images at the left are the wire-frame of the redesign for the interface of VERiiF's page.

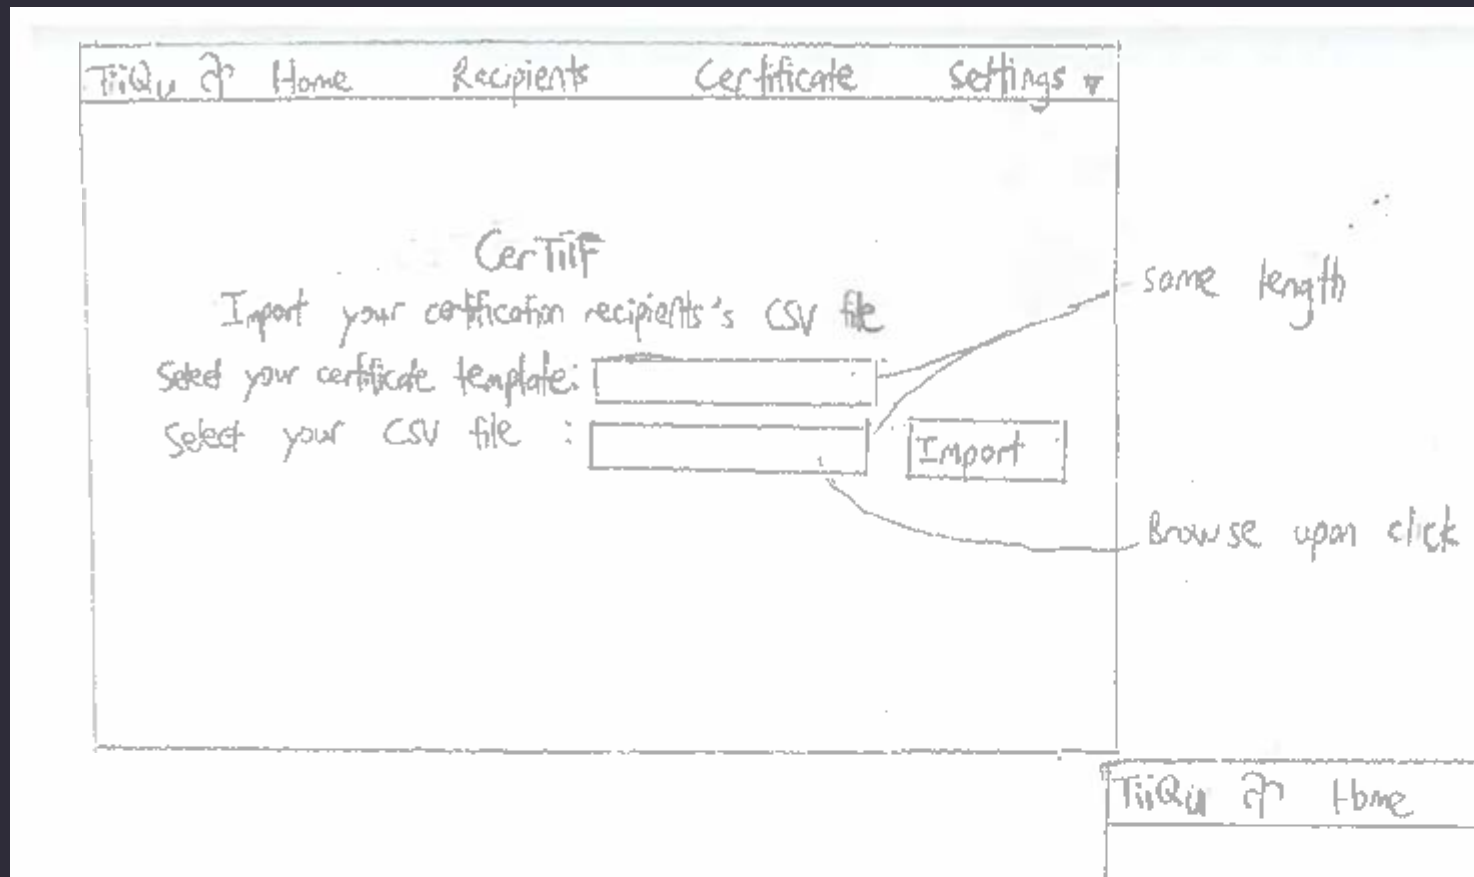

For VeriiF page, we changed a little bit for the "certificate selection" page's buttons and flows.

While at the "Verification Results Pass" page, we focus more on the:

1. Utilise negative space
2. Better presentation of certificate details
3. Result details visual
4. Certificate verified animation

Therefore, we sketch a few wire-frames for each pages of VERiiF to decide which one to select and proceed to the next step.

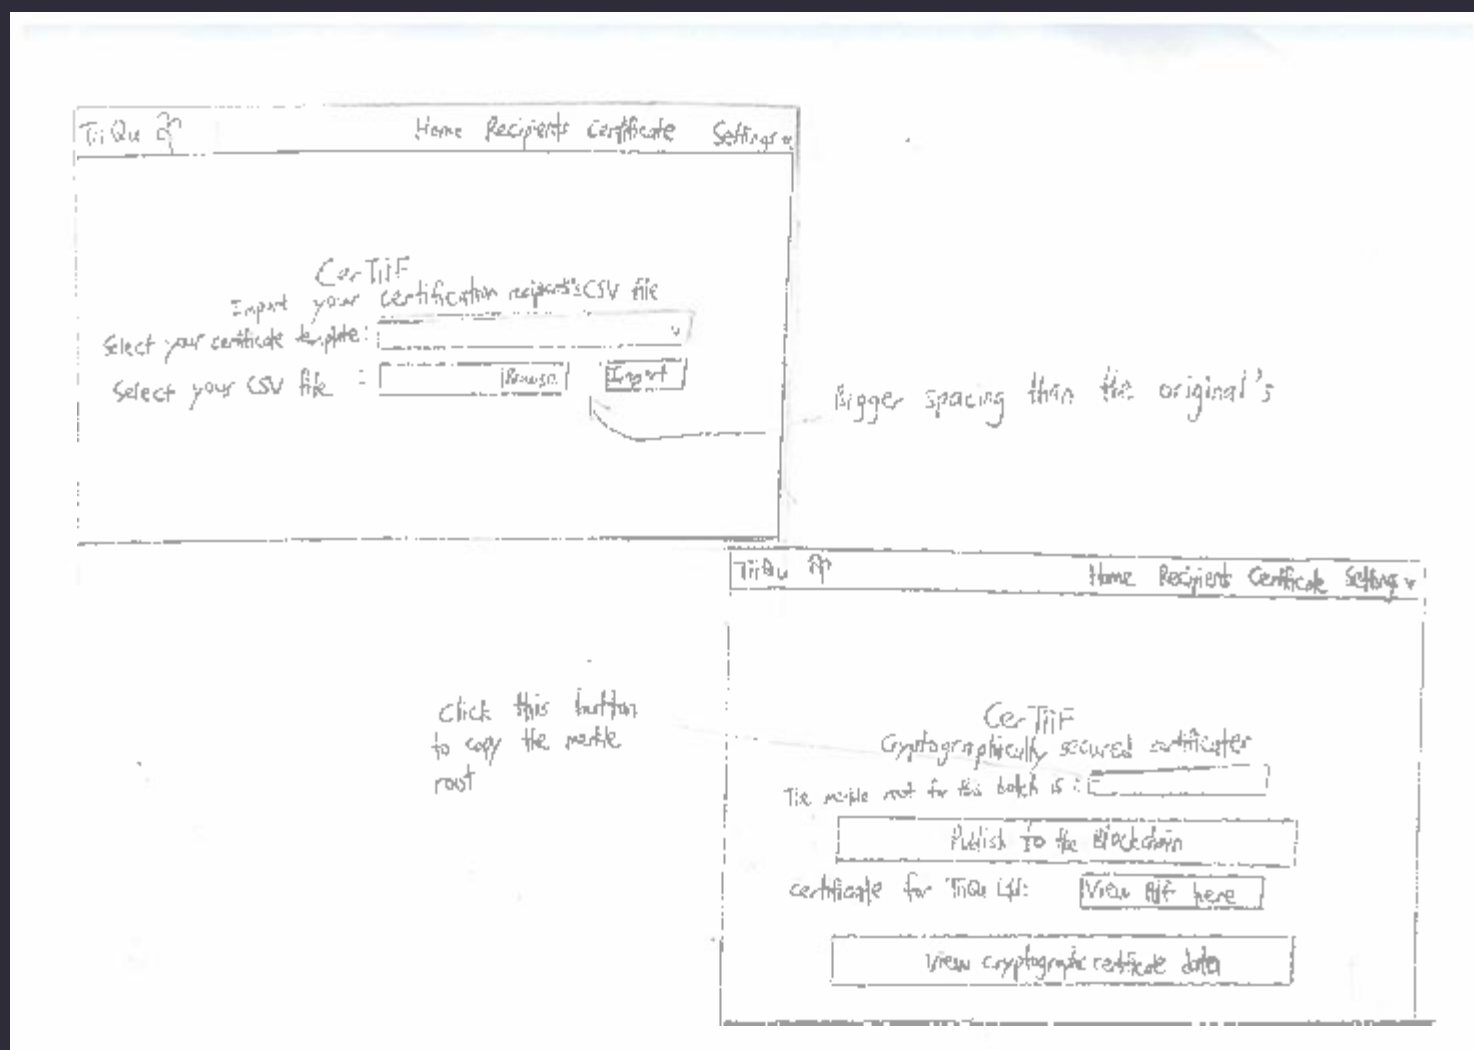

Images at the left are the wireframe of the redesign for the interface of CerTiiF's "Selection" page.

"Selection" page is the page that allows user to select the CSV file of the certificate and import it from his/her computer.

In the Selection page, the aspect we focus on are:

1. Centralise page elements
2. Tidy up element spacing

Selection page and "Cryptographically secured certificates" page

"Cryptographically secured certificates" page allows user to preview the files that he/she is going to publish to the block-chain in PDF format and enable the user to see the merkle root of the file. Merkle root is important because if there is any changes in the files, the codes of the merkle root will change subsequently.

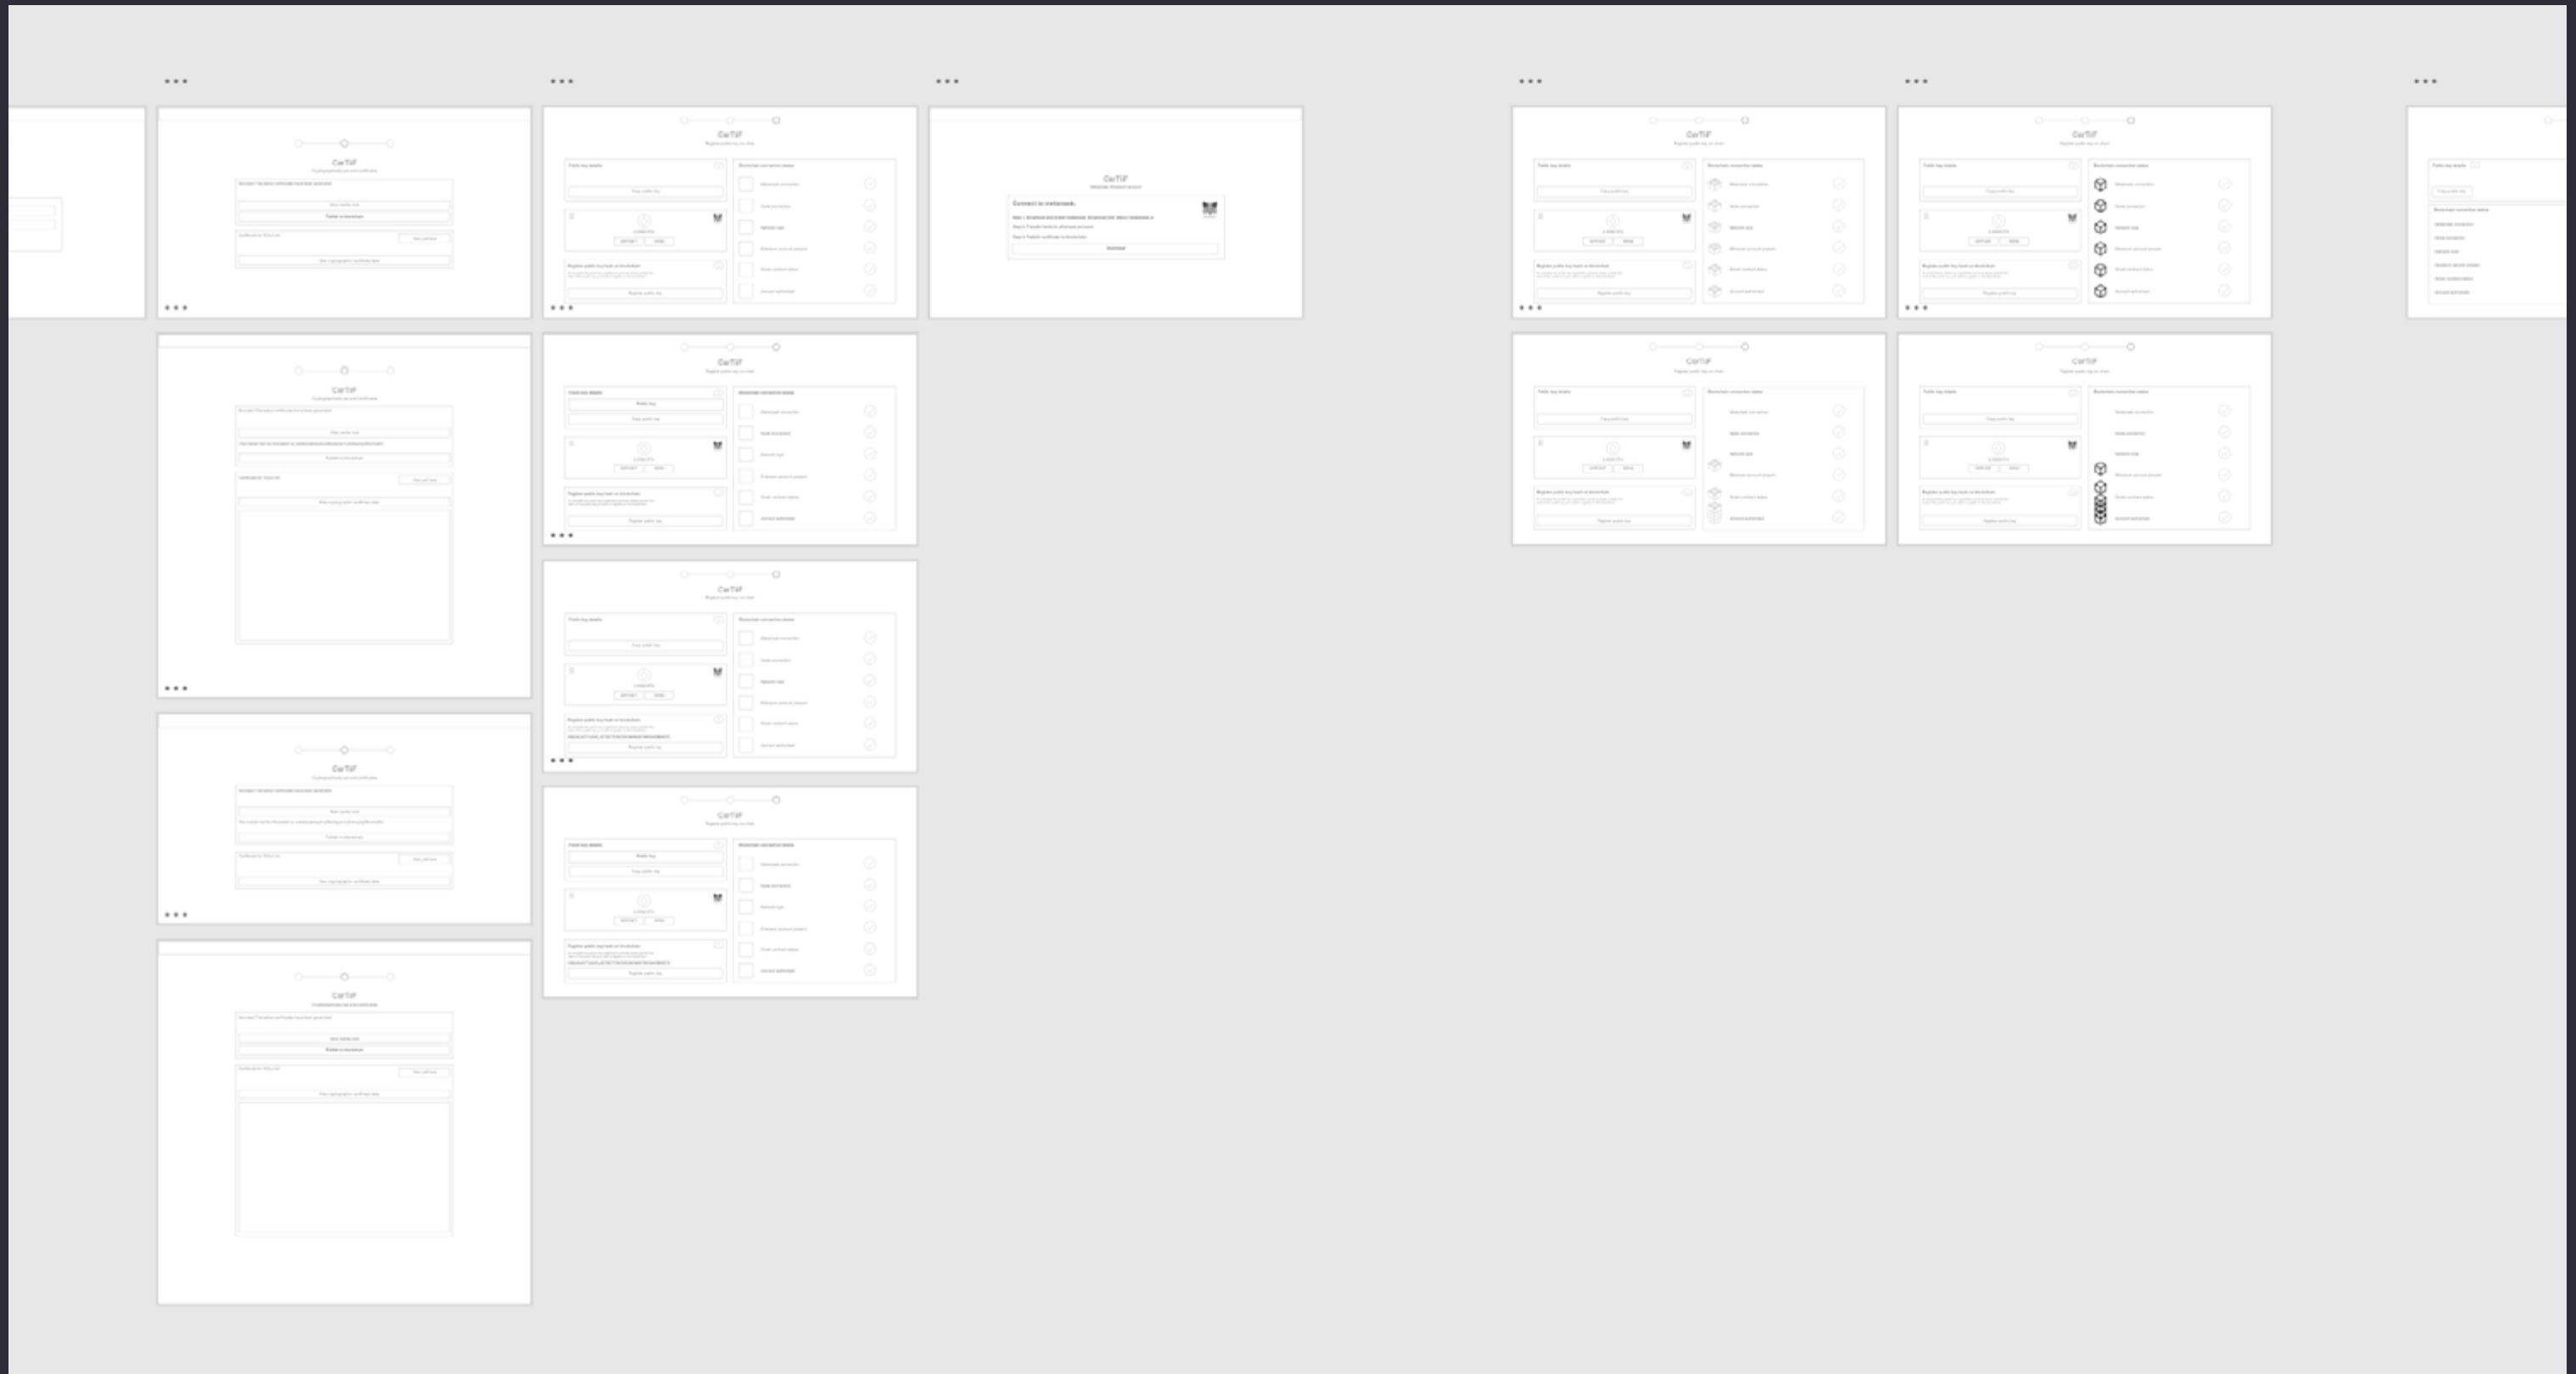

In this page, things that we will change are:

1. Hide merkle root, alternatively use a button that can copy the root upon Clicking on it.
2. Add more consistent colours

# Low Fidelity Mock Ups

Before our meeting with Laura we created some low fidelity mock ups on Adobe XD to give Laura a better of where we hope to steer the project in the coming weeks based on the original wireframes we had developed

# Meeting Review

## Meeting Review

We held a meeting with Laura to give her updates on how we were getting on. we set up a presentation to display what we had achieved so far.

Overall we have learned from areas where we could improve from and we gained better insight into the software and how they want it to be used by the user.

### Notes Taken:

*Make it easy*

*Not priority to see the merkle root - Simple explanation*

*"The priority is the customer"*

*View PDF sent from Laura*

*Does the user care about block-chain connection status?*

*Add progress bar (red to green)*

*Look to include the fox logo to link meta-mask*

*The customer must "enjoy" the process*

*The customer must feel that is it fast using the software*

*VERiiF information is valuable to the user, must include more information in that sector*

*"Information must reach to the customer in the eye"*

*Try not to include too much information about Block-chain, customer doesn't need to know about that*

Moving forward after gaining advice from Laura, we are go to back to the drawing with redesigning new wire frames taking on-board what we have told to alter or make better to make it suit what TiiQu are looking for.
